PATCH LINING & PIPELINE REHABILITATION

ENVIRO-CLEAN

Along with our Suction Excavation and Ultra High-Pressure Jetting capabilities we also offer internal pipeline repairs as another innovative tool to avoid unnecessary mechanical excavation of the roads and highways.

Patch Lining and Pipe Rehabilitation offers a highly efficient and cost-effective approach to pipe repair, whether above or below ground. Whether through a patch liner of up to 3 metres in diameter for localised areas of concern or a full-length section of up to 250 metres to strengthen an entire pipe section these methods offer exciting options for our clients. These solutions are versatile and capable of returning all pipe types to full operational integrity. Most commonly used in the water industry, we have repaired sewer, surface, and effluent pipes, returning them to full operational integrity.

The 'no-dig' process ensures minimal disruption to your sites or the public roads. Without the need for open excavations, there is no risk of utility strikes, fewer hazards, and no requirement for TTRO permits or Complex Traffic Management. This straightforward system enables prompt repairs, preventing further damage, avoiding pollution to local watercourses, and quickly resetting critical industrial processes.
